Junior Python Backend Developer

Experience: 0-2 years | Engineering | Fictional test vacancy

ROLE OVERVIEW

Build and maintain Python web APIs and database-backed services. Fresh graduates may demonstrate relevant experience through internships, coursework or personal projects.

REQUIRED SKILLS

Python fundamentals, object-oriented programming and basic data structures.

Practical use of Flask or Django to build REST APIs.

SQL, relational database design and integration with PostgreSQL, MySQL or SQLite.

Git version control, debugging and unit testing with pytest or unittest.

RESPONSIBILITIES

Implement API routes, input validation and useful error responses. Connect APIs to a relational database and maintain readable Python code.

Write unit tests, troubleshoot defects and participate in code reviews. Explain your contribution and design decisions for at least one relevant project.

PREFERRED QUALIFICATIONS

Practical use of Docker and basic deployment to AWS.

Basic HTML, CSS and JavaScript for integrating a simple web interface.

Use of Pandas for a small data-processing or reporting task.

EDUCATION

Computer science or a related qualification, or equivalent practical learning. Professional employment is not required for fresh graduates.
